

JASON DAGANA

Fullstack Software Engineer | React | Next.js | TypeScript | Node.js | React Native

Abuja, Nigeria | +2349013642811 | daganajason72@gmail.com | [portfolio](#) | [github](#)

PROFESSIONAL SUMMARY

Full-stack engineer and mobile app developer with hands-on experience shipping production systems across transportation, media, and edTech, building with React, Next.js, React Native, and TypeScript. I work closely with design, backend, and product from early architecture decisions through to release, owning critical modules within core business flows — including a live national railway ticketing platform projected to serve close to one million passengers annually.

TECHNICAL SKILLS

- **Languages:** JavaScript (ES6+), TypeScript, HTML5, CSS3, Python
- **Frontend:** React, Next.js, React Native, Zustand, Redux, Context API, TanStack Query, TanStack Table
- **UI & Styling:** Tailwind CSS, responsive design, component systems, design-to-production implementation
- **Backend & Databases:** Node.js, Django, PostgreSQL, REST APIs, authentication flows (JWT, session cookies)
- **Engineering Practices:** Performance optimization, data fetching strategies, caching, production debugging, bundle awareness
- **Tools:** Git, GitHub, API integration workflows, deployment workflows

PROFESSIONAL EXPERIENCE

Frontend Software Engineer Feb 2025 – Aug 2025

Nigerian Railway Corporation (NRC) | nrc-fane.ng

Tech stack: Next.js, TypeScript, Tailwind CSS, TanStack Query, REST API

- **Designed the seat reservation countdown system** with server-side re-validation before payment — ensuring payment could not complete against an already-expired seat hold, resolving a critical race condition identified during design.
- **Owned the Booking Control admin module end-to-end**, from API contract discussions through to UI delivery, giving operations staff direct control over booking windows and seat-hold timing without engineering intervention.
- **Shipped a full audit logging interface** surfacing a traceable record of all admin configuration changes; negotiated with backend on event capture scope and where filtering responsibility should sit.
- **Built paginated, filterable data tables** using TanStack Table for operational monitoring, working within the existing backend pagination contract rather than redesigning data access.

Frontend Engineer 2025

NewsBridge AI | Early Team Member | newsbridgeai.com

Tech stack: React, TypeScript, Next.js, TanStack Query

- **Led frontend architecture across the initial production build** in a multi-developer team, defining application structure, data flow patterns, and integration strategy in a rapidly evolving Next.js codebase.
- **Implemented server-secured auth using HTTP-only cookies and Next.js middleware**, enforcing session validation before protected routes rendered and eliminating client-side token exposure.
- **Integrated a WhatsApp-based anonymous reporting pipeline** into the frontend data flow, surfacing submissions as real-time journalist feeds with coordinated polling and cache invalidation strategies.

Full-Stack Engineer 2025 – Present

DataTechHub | Freelance Contract | datatech-rho.vercel.app

Tech stack: React, Next.js, TypeScript, Node.js, JWT Authentication

- **Shipped the user-facing frontend and landing page** for Nigeria's premier Data and AI learning platform — responsive layouts, authenticated user flows, design to production.
- **Caught a mid-development API response shape change** before production: updated responses would have caused dashboards to silently render empty. Flagged it, got the contract corrected, and updated the integration layer.

SELECTED PROJECTS

Digital Banking System | [github](#)

Tech stack: Node.js, Express.js, MongoDB, Mongoose, JWT, NIBSS API

- **Built a backend banking system** integrated with the NIBSS by Phoenix API for real identity verification (KYC) and interbank settlement — supporting registration, account creation, transfers, and transaction history.
- **Ensured data isolation and security** with bcrypt password hashing, KYC IDs stripped from every API response, and every transaction query scoped strictly to the authenticated customer.

EDUCATION

BSc in Pure and Applied Mathematics 2017 – 2022

Niger Delta University, Bayelsa State, Nigeria

CERTIFICATIONS

Software Engineering Certificate Nov 2025 – May 2026

TS Academy

Lagos, Nigeria

Birmingham, UK
